DETAILED ACTION

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 06/02/2008 has been entered.

Allowable Subject Matter

Claims 1, 2, 4-8, and 10-11 are allowed.

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with David Dagg on 06/18/2008.

The application has been amended as follows: Claim 1 is amended to read,
1. (currently amended) A method operating on a client computer for loading a markup language document, said method comprising the steps of:

receiving said document comprising a plurality of tags, at least one of said plurality of tags being a custom tag[[s]];

parsing said document to determine if certain of said plurality of tags ~~are~~ is said custom tag, wherein said parsing includes scanning a document object model (DOM) representation of said document for the presence of said custom tag[[s]];

inserting, by ~~said~~ a Web browser executing on said client computer and prior to rendering of said document on a display device, executable instructions into said document at a location of said custom tag, if said custom tag is present, wherein said inserting includes modifying said DOM representation of said document to replace said custom tag with said executable instructions, wherein said executable instructions are for rendering a tree control display;

executing said executable instructions for rendering said tree control display; and
rendering said document including said tree control display on said display device.

Claim 6 is amended to read,

6. (currently amended) A method for creating and providing a markup language document to a receiving computer, said method comprising the steps of:

loading said document into a memory on a server computer, said document containing conventional tags and at least one custom tag, said custom tag associated with machine-executable instructions resident on said receiving computer in communication with said network;

providing said document from said server computer to said receiving computer over said network; and

said receiving computer identifying said custom tag, wherein said identifying includes scanning a document object model (DOM) representation of said document in said receiving computer for the presence of said custom tag, and inserting, by said a Web browser executing on said client computer and prior to rendering of said document on a display device, said machine-executable instructions into said document at a location associated with said custom tag, wherein said inserting includes modifying said DOM representation of said document to replace said custom tag with said machine-executable instructions, wherein said executable instructions are for rendering a tree control display.

REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance: The prior art of record fails to anticipate or otherwise disclose, either alone or in combination, the combination of limitations recited in the independent claims.

Specifically, claims 1, and 6 generally describe a markup language document stored in memory on a server computer containing at least one special or "custom" tag.

The custom tag is associated with executable code residing on a receiving computer (i.e. client). A web browser, resident on the receiving computer, requests and receives the markup language document containing at least one custom tag and proceeds to identify the custom tag.

The identification of the custom tag is performed on a document object model (DOM) representation of the received markup language document. Once identified, the custom tag is replaced with the associated executable code residing on the receiving computer, thereby modifying the DOM. Prior to rendering the markup language document to the web browser display; the browser executes the executable code to generate a tree control display (e.g. an expandable menu).

This approach differs from the prior arts of Lennox and Grober in that neither of them processes a DOM representation of a document in order to identify and/or replace a detected custom tag within the DOM with machine-executable instructions, where those machine-executable instructions are for rendering a tree control display.

In addition, Grober relies on the continued presence of the custom tags and therefore would not function if those custom tags were replaced.

In general, the prior art of record fails to disclose the replacement of custom or other tagging present in a markup document or DOM representation of a markup document with executable code. That is, inserting or embedding the executable code into the markup document or its DOM representation and executing that code prior to display of the document by a web browser. Custom tags encountered in markup language documents or DOM representations generally amount to no more than function calls which "call" executable code which is external to the document/DOM and remain so (i.e. are not inserted or embedded).

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
